MICHAEL GOYTIA

916.223.1357 /// MICHAEL.R.GOYTIA@GMAIL.COM /// GITHUB.COM/GOYTIA54

TECHNICAL

PROGRAMMING LANGUAGES

EXPERT // Scala, Java, Python
PROFICIENT /// SQL(Oracle, Postgres), PHP, NoSQL(MongoDB, DynamoDB)
COMPETENT /// C#, C++, JavaScript

OTHER

PROFICIENT /// AWS, REST, API design, Django, Flask, Linux, Bash, VIM, Visual Studio, Git, IntelliJ, PyCharm, Docker, Play Framework, Jenkins, Swagger-UI, Mockito, GitHub Actions, Terraform, Kubernetes, ZIO, Spring, XML, XSL JSON, AI-Assisted Development
COMPETENT /// Spring Boot, pytest, Akka, Protobuf

EDUCATION

M.S. CHEMISTRY — *Emphasis in Theoretical and Computational Chemistry*
UNIVERSITY OF UTAH
SALT LAKE CITY, UT /// MAY 2017 /// GPA 3.8

B.S. CHEMISTRY
BRIGHAM YOUNG UNIVERSITY-IDAHO
REXBURG, ID /// APR 2015 /// GPA 3.4

WORK EXPERIENCE

SENIOR PRODUCT ENGINEER
THE WALT DISNEY COMPANY
REMOTE (SALT LAKE CITY, UT) /// MAY 2026 – PRESENT

- Designed and delivered an automated host failure detection and disabling system end-to-end — a NoSQL-backed failure tracking system with configurable thresholds, rolling time windows, and feature-flagged rollout across multiple services, directly eliminating recurring oncall pages from known failure patterns (Scala, ZIO, AWS: DynamoDB, Datadog, Terraform).
- Led a backwards-compatible output pathing initiative across six microservices, introducing a new routing signal for updated hardware while preserving existing workflows and fixing a correctness bug in HDR classification that would have caused incorrect downstream processing (Scala, ZIO, Java, Spring, Kafka, Terraform).
- Contributed engineering work across 10 of 25 annual roadmap initiatives including new codec support, cloud migration, advertisement processing, and new product type enablement.
- Built a lightweight local testing tool enabling engineers to run full orchestration pathways end-to-end without a deployed environment, improving developer velocity and catching integration issues earlier in the development cycle (Docker, Scala, Java).
- Proactively identified and fixed high-impact production reliability issues: timeout responses silently misclassified as success, duplicate events causing phantom job failures, and jobs stuck in a running state when retry limits were exceeded.
- Authored 15 technical proposals and design documents; contributed to every monthly release plan throughout the year.
- Mentored three engineers, contributed to cross-team bug discovery across adjacent platform services, and presented AI-assisted development techniques to the broader organization.
- Helped the media manufacturing platform reach a daily processing record of 5.8 million jobs — a 3.7x increase over the start of the year — through cumulative throughput improvements, cloud processing expansion, and reliability work.

SENIOR SOFTWARE ENGINEER
THE WALT DISNEY COMPANY
REMOTE (SALT LAKE CITY, UT) /// AUG 2024 – MAY 2026

- Led migration of critical database systems from MySQL 5.7 to MySQL 8, improving performance, scalability, and long-term maintainability (Postgres, Java, Spring).
- Collaborated with DBA teams to design and implement a robust cutover strategy, resolving primary key auto-increment conflicts across multiple environments.
- Upgraded essential dependencies to enable seamless failover between writer and reader nodes, ensuring high availability and operational resilience (Java, Spring).
- Executed database cutovers with zero data loss, maintaining uninterrupted processing of active workloads and preserving transactional integrity.
- Demonstrated technical leadership, cross-functional collaboration, and meticulous attention to detail throughout a complex migration initiative.
- Developed and validated interface applications, enabling seamless communication between media processing devices and manufacturing orchestration systems (Java, Spring).
- Collaborated across packaging and manufacturing teams to troubleshoot integration issues, ensuring alignment for the Content Characterization initiative (Java, Spring, Scala, ZIO, AWS, Kafka, Terraform).
- Created and executed comprehensive test plans, guaranteeing successful delivery and system reliability.
- Led a resource metrics initiative to improve visibility into system resource utilization within the media processing pipeline, enabling better performance monitoring and capacity planning (Java, Spring, Scala, ZIO, AWS: Step Functions, DynamoDB, MSK and SQS, Terraform).
- Drove the project end-to-end, including discovery, requirements framing, execution, validation, and release.
- Collaborated with cross-functional stakeholders, including acquisition and tooling teams, to ensure alignment and maximize impact across engineering groups.
- Co-led and successfully delivered a high-visibility project, ensuring timely enablement of video art workflows for browser-based streaming experiences.
- Performed comprehensive end-to-end testing, uncovering integration gaps between manufacturing, packaging, and preset services.
- Facilitated cross-team collaboration to resolve system discontinuities, aligning preset override configurations and orchestration logic.
- Developed detailed test plans and validation strategies, guaranteeing accurate data flow and reliable system performance.
- Demonstrated leadership, problem-solving, and cross-functional coordination during a critical delivery period with reduced team capacity.
- Assisted in designing a new architecture for resource pool-controlled workflows, enabling faster job scaling and reducing cloud costs (Scala, ZIO, AWS: Step Functions, DynamoDB, MSK and SQS, Terraform).
- Developed and optimized core components of the lifecycle, including task submission, termination handling, and data modeling.
- Implemented performance improvements such as pagination for task queries and optimized database updates to minimize unnecessary capacity changes.
- Designed and integrated AWS SQS consumers, DynamoDB indexes, and Kafka topics to support reliable task orchestration and messaging.
- Enhanced local testing and deployment workflows by creating Docker Compose resources and refactoring dependency injection.

• Executed cutover from a legacy application to this new application, increasing daily media manufacturing throughput from 1.4M to 3.2M (142% increase) jobs with minimal production impact.

SOFTWARE ENGINEER II
THE WALT DISNEY COMPANY
REMOTE (UT) /// MAR 2022 – AUG 2024

• Led migration of transcode orchestration workflows to a modern service, improving efficiency and scalability for major initiatives such as Unified Ads and MAX on Hulu catalog backfill (Scala, ZIO, AWS: Step Functions, DynamoDB, MSK and SQS, Terraform).
• Designed and executed a multi-phased deployment strategy, reducing risk and ensuring uninterrupted processing during large-scale changes.
• Developed, validated, and documented mission-critical interface applications during a staffing shortage, supporting Packaging and Processing teams (Java, Protobuf).
• Facilitated cross-team collaboration on flexible preset support, introducing best practices and tools to improve productivity and processes.
• Expanded domain expertise in media manufacturing, completing diverse tasks, resolving on-call issues, and sharing organized knowledge resources to enable team growth.
• Contributed to multiple design proposals and implementations, simplifying cross-system communication within manufacturing orchestration and reducing operating expenses.
• Led migration of legacy dynamic ads insertion (DAI) flow, advancing platform unification and improving system reliability (Scala, ZIO, AWS: Step Functions, DynamoDB, MSK and SQS, Terraform)
• Scoped, defined tasks, and delegated work for AWS Elemental normalization stage removal, eliminating external dependencies and enabling data center cutover for DAI workflows.
• Designed and implemented key features for a modern transcode orchestrator, supporting a new HDR codec workflow and unifying Disney streaming platforms.
• Delivered critical contributions to projects for enhancing video processing pipelines and improving consumer experience while reducing operational costs.
• Provided extensive code reviews and refactoring recommendations, improving code readability, maintainability, and overall quality.
• Demonstrated strong initiative in professional development, engaging in training, cross-team collaboration, and knowledge-sharing opportunities.
• Maintained high execution throughput across multiple functional areas, consistently delivering complex tasks under tight timelines.
• Contributed to core services and workflow enhancements, including new stages and feature additions to media manufacturing applications, enabling successful delivery of media assets with advertisement entry points.
• Improved infrastructure and automation by implementing Terraform updates, pre-commit hooks, and setting up EKS environments with Spinnaker for deployments.
• Actively collaborated across teams, ensuring effective knowledge sharing and smooth integration of new features.
• Demonstrated strong initiative in learning and domain expertise, documenting findings and sharing insights to support team growth.
• Provided meaningful code reviews and refactoring recommendations, improving code quality, readability, and maintainability.
• Committed to professional development, engaging in training, cross-team interactions, and presentation opportunities to broaden technical and organizational impact.

SOFTWARE ENGINEER
OPTCONNECT
REMOTE /// JUL 2020 – DEC 2021

• Enhance and maintain a customer facing API that is used for managing Internet of Things (IoT) devices (Scala, Play Framework, Akka, Angular, Swagger UI)
• Make updates to customer facing API documentation to provide a better user experience and effortless implementation
• Automated deploys of documentation and API definitions (AWS CLI/API Gateway, GitHub Actions)
• Developed integration and regression tests to ensure stability when running deploys
• Converted user requests into endpoint features and enhancements
• Expanded unit testing of API code base by 50% to increase confidence in making continuous changes
• Enhance and maintain a cloud application (Python, AWS Lambda/API Gateway/SQS, MongoDB) used for syncing customer and IoT device data from Oracle NetSuite restlests (ONSR).
• Deploy new features and bug changes for cloud application using the serverless framework and Jenkins
• Developed a data sanitation library(Python, PyPi, marshmallow, AWS CodeArtifact) to better visualize invalid data points in various internal applications that consume ONSR
• Documented business logic that make up the definitions used for said data sanitation.
• Automated deployments of sanitation library using Jenkins Pipeline and AWS Command Line Interface (CLI).
• Developed an internal application(Python, Django, Bootstrap 3) to be used by NetSuite developers and the operations department
• Developed features for Netsuite developers to test existing and new restlests to ensure changes are compatible with defined business logic and to accelerate development
• Developed features for the operations department to view and correct invalid data points returned in NetSuite restlests
• Documented application functionality and user flows to ensure better adoption/use of application
• Developed a CI/CD pipeline using Jenkins Pipeline to provide frequent and automated deploys

SOFTWARE ENGINEER
GALILEO FINANCIAL TECHNOLOGIES
SALT LAKE CITY, UT /// MAY 2019 – JUN 2020

• Internal and payment processing API teams
• Architected and contributed to the development of a new API for internal customer service and cardholder dispute applications
• Architected and developed the integration of Mastercard's Mastercom API to handle cardholder disputes in real time
• Architected and contributed to the development of Galileo's public facing API documentation
• Converted legacy PHP API into Python Flask API via test driven development
• Created an authentication API to allow public access to payment processing APIs which traditionally had restricted access
• Created and reformed API contracts to ensure the creation of quality endpoints
• Managed deploy process from testing, client validation, to production
• Implemented swagger documentation libraries to help guide and solidify the structure of endpoints as well as provide documentation for the business
• Developed custom Marshmallow schemas to sanitize and validate inputs into the API
• Expanded testing suite by over 100% to ensure full coverage of code
• Wrote a variety of automated test cases ranging from unit to end-to-end to harden the API code
• Trained and mentored 2 junior engineers

TECHNICAL LEAD
GALILEO FINANCIAL TECHNOLOGIES
SALT LAKE CITY, UT /// NOV 2019 – MAR 2020

• Technical lead for Money+, a mobile and web banking application for registered investment advisors
• Team was disbanded due to cut in Federal Funds Rate
• Led a team of 2 full-time and 2 intern software engineers
• Led the development of the business logic, API, used by the Money+ web and mobile applications
• Oversaw and contributed to the development of the logic needed to handle the opening of joint, business, and beneficiary accounts within Galileo's payment processing API
• Refactored a single-file web application into an up-to-date enterprise Flask API using Flask Blueprints, Marshmallow Schemas, and Apispec for proper documentation

- Oversaw and contributed to the implementation of unit and integration tests to harden the API code.
- Trained team members on best practices for various topics such as version control, documentation, and testing
- Worked with software delivery team to implement automated building and deployment of API

SOFTWARE ENGINEER
MYRIAD GENETICS
SALT LAKE CITY, UT /// MAR 2018 - MAY 2019

- Upgraded legacy applications by separating logic into front and back end solutions
- Led API design sessions with developers
- Created and upgraded back end applications with Spring Boot
- Created wire frames and mock-ups and presented them to users for feedback
- Implemented designs with Vue.js and Vuetify to create modern web applications
- Developed and implemented new features in our legacy applications with many technologies such as JBOSS, Spring MVC, and Grails
- Created idempotent DML and DDL SQL deploy/rollback scripts
- Created software requirements and provided risk scores used in verification for our SDLC process.
- Wrote test cases, manual and automated, integration and mock, to provide durability for the products we create and maintain
- Wrote Python programs to mock the functionality of instruments used in the labs to produce realistic data for testing
- Worked beside a support engineer to address failures in production
- Created test data for other informatics teams to use during validation of processes before going to production

SOFTWARE DEVELOPER INTERN
MOTOROLA SOLUTIONS
SALT LAKE CITY, UT /// OCT 2017 - MAR 2018

- Developing models based on existing XSL transforms for XML screens used for querying state databases.
- Writing unit tests to confirm the translation of XML data to Java objects and to validate the controller's generation of content for query messages
- Developing controllers to generate the contents of a query message based on the query models

SOFTWARE AUTOMATION ENGINEER INTERN
3M HIS
SALT LAKE CITY, UT /// MAY 2017 - AUG 2017

- Implementing and maintaining automation test cases for the internal framework
- Creating page objects via Selenium drivers and browser APIs
- Developed a local ASP.NET .NET Core web application to report automation test results
